Introduction

When you open a computer, usually this will either be a Windows PC or a Macintosh computer. They will have different user interfaces or applications that may be specific to that computer. The Windows or the Mac are called *operating systems*.

The **Operating System (OS)** is a layer of software which is used to manage computer resources. It also provides an interface, so that users can utilize computer resources. It configures and manages hardware to connect the components and the applications.

TOPIC 1: Different Operating Systems

The three most popular operating systems are **Windows**, **MAC**, and **Linux**.

- Windows is the dominant over the other two. 90% of computer users use Windows operating system.
 - Windows and MAC are expensive operating systems however, MAC OS requires the users to buy the MAC systems (Macbook, Mac) built by Apple.
 - On the other hand, Linux is a free operating system.
 - Windows and MAC have similar file structures while Linux has a different code base (single file tree compared to Windows and MAC's many directories)
 - Windows interface has a Start menu, Taskbar, System Tray, and the Windows Explore while Linux has easy to switch interfaces.
 - Linux is most preferred by programmers, MAC is preferred by graphic artists, and Windows is preferred by gamers.
