TOPIC 1: Using Modules

- [List of Modules/Add-ons](#)

TOPIC 2: Installing Modules/Add-ons

Introduction

One must be able to load modules and add-ons so that you can access their functions. Modules will contain other modules. But however, modules are independent and can be used without the other depending on the needs of the server.

This lesson will briefly go through the different modules and add-ons that you may utilize for the server.

TOPIC 1: Using Modules

The **module** is the package that contains Windows PowerShell commands. Examples of these are ascmdlets, providers, functions, workflows, variables, and aliases.

You are able to write commands with these modules to organize commands and share with others.

Those who will receive modules can add commands in the modules to their Windows PowerShell sessions to use them like built-in commands.

List of Modules/Add-ons

The following are modules which support different functions and features in the Windows Server OS.

1. Active Directory module
2. Active Directory Rights Management Services module
3. Active Directory Rights Management Services Administration module
4. Application ID Policy Management module
5. Best Practice Analyzer module
6. Background Intelligent Transfer Service (BITS)
7. Failover Clusters module
8. Group Policy module
9. Network Load Balancing Clusters module
10. Remote Desktop Services module
11. Server Manager module
12. Server Migration module
13. Internet Information Services (IIS) module

TOPIC 2: Installing Modules/Add-ons

The following are the steps you should follow in installing modules/add-ons.

Procedure:

Step 1: Find all “Module” commands

In the PowerShell window, type the following command and press ENTER:

Get-Command –Noun Module

Step 2: List all modules that are available

In the PowerShell window, type the following command and press ENTER:

Get-Module –ListAvailable

Step 3: Load the ServerManager module into the current session

In the PowerShell window, type the following command and press ENTER:

Get-Help Import-Module

In the PowerShell window, type the following command and press ENTER:

Import-Module ServerManager
